IIT JAM Mathematical Statistics: Previous-Year Paper Analysis

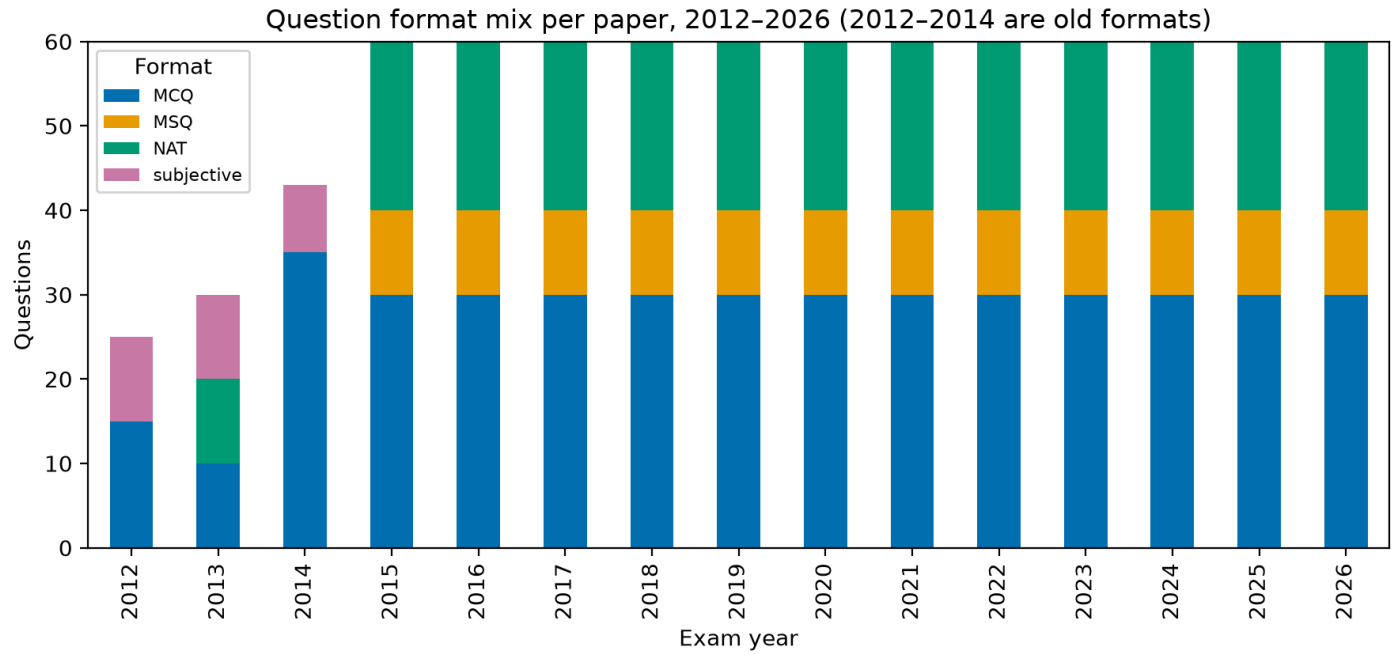

Scope: 12 current-format papers (2015–2026, 60 questions / 100 marks each), 720 questions. Old-format papers 2012–2014 are reported separately. Taxonomy: official JAM 2026 MS syllabus (plus a pre-2026 Differential Equations topic). Evidence tags: strong = seen in nearly every paper; moderate = consistent but small or recent; weak = few observations.

1. Summary

- **Statistics carries 64.8% of marks, Mathematics 35.2%.** strong
- **Univariate Distributions, Estimation and Multivariate Distributions** are the heaviest topics (14.5%, 13.7%, 10.9% of a paper on average); together **39.2%**. strong
- Every main syllabus topic tested before 2026 (so not the dropped Differential Equations or the topics new in 2026) appears in at least 11 of 12 papers: **no topic is skippable**. strong
- **The paper is shifting** from calculus towards distribution theory: comparing 2015–2018 with 2024–2026, Integral Calculus fell 10.2% → 5.0% while Sampling Distributions rose 3.5% → 7.7%. moderate
- **44.6%** of questions (321/720) reuse the problem structure of an earlier question with new numbers or set-up; 0 are word-for-word repeats. Drilling past papers by structure pays off. strong
- Differential Equations appear only in 2012–2016 and not since; they are not in the 2026 syllabus. strong
- **New-syllabus topics arrived in 2026.** 7 subtopics never tested in 2015–2025 appeared for the first time in the 2026 paper: **9** questions, **14** of 100 marks (Correlation and bivariate data, Markov chains, Measures of central tendency and dispersion, Poisson process, Quadratic forms and definiteness, Runs test, Sign tests). strong (one paper; their future weight is unknown)
- 4 syllabus subtopics are still untested in 2015–2026 (Limits and continuity (two variables), Moments, skewness and kurtosis, Empirical distribution function and Kolmogorov-Smirnov test, Mann-Whitney test). Treat them as unknown, not low priority.

2. Examination overview

Format since 2015: 30 MCQ (Section A), 10 MSQ (B), 20 NAT (C); 10+20 one/two-mark MCQs, two-mark MSQs, 10+10 one/two-mark NATs. Question styles: numerical 47.8%, application 22.2%, conceptual 22.6%, everything else 7.4% (subjective labels).

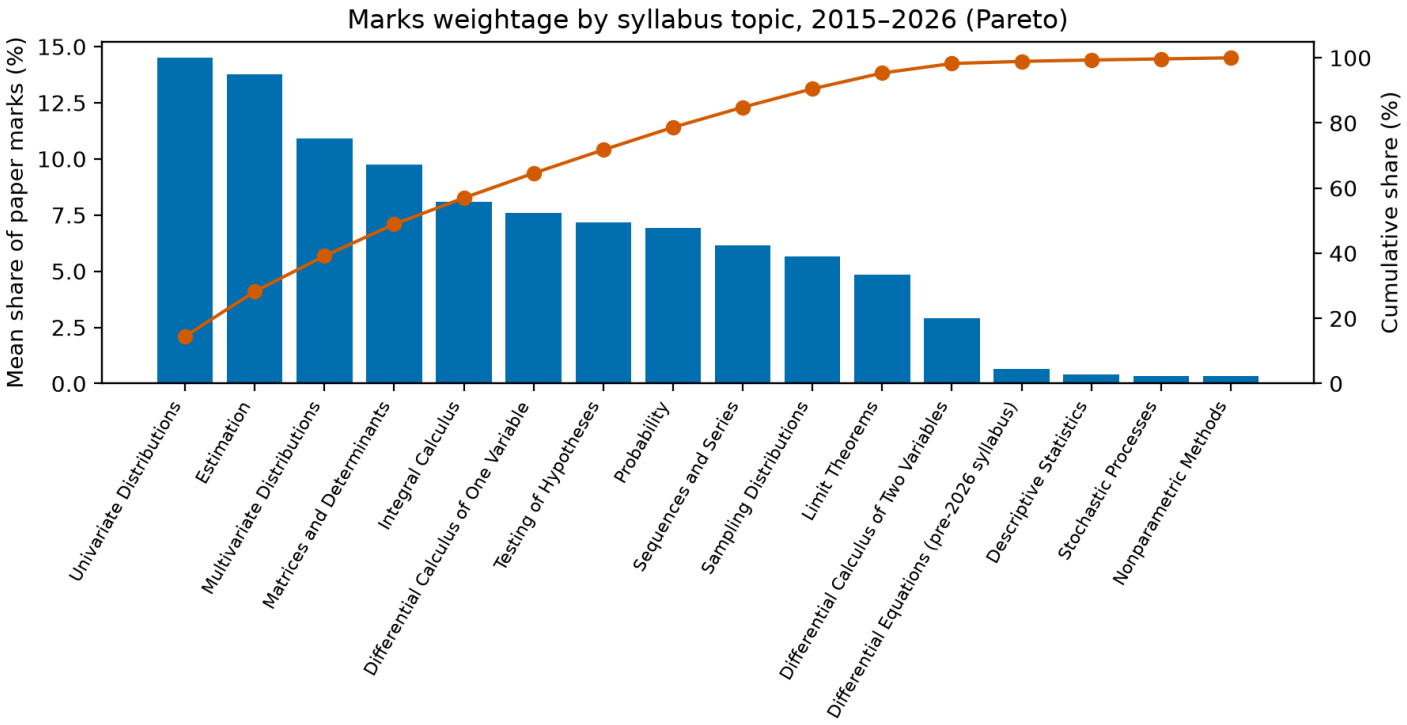

Source: JAM MS papers 2012–2026; top-level questions

3. Topic frequency and weightage

Marks share is the average over papers of (topic marks ÷ 100), so every paper counts equally. Frequency, weightage and consistency are separate columns.

Subject	Topic	Questions	Papers (of 12)	Mean marks share	Questions 2024–2026	Problem structures
Statistics	Univariate Distributions	109	12	14.5%	24	58
Statistics	Estimation	94	12	13.7%	24	42
Statistics	Multivariate Distributions	75	12	10.9%	21	42
Mathematics	Matrices and Determinants	71	12	9.8%	16	43
Mathematics	Integral Calculus	59	12	8.1%	9	22
Mathematics	Differential Calculus of One Variable	54	12	7.6%	10	33
Statistics	Testing of Hypotheses	50	12	7.2%	14	17
Statistics	Probability	51	12	6.9%	13	27
Mathematics	Sequences and Series	48	12	6.2%	10	21
Statistics	Sampling Distributions	42	11	5.7%	15	22
Statistics	Limit Theorems	36	12	4.8%	11	19
Mathematics	Differential Calculus of Two Variables	19	11	2.9%	5	5
Mathematics	Differential Equations (pre-2026 syllabus)	4	2	0.7%	0	1
Statistics	Descriptive Statistics	3	1	0.4%	3	3
Statistics	Stochastic Processes	3	1	0.3%	3	3

Subject	Topic	Questions	Papers (of 12)	Mean marks share	Questions 2024–2026	Problem structures
Statistics	Nonparametric Methods	2	1	0.3%	2	2

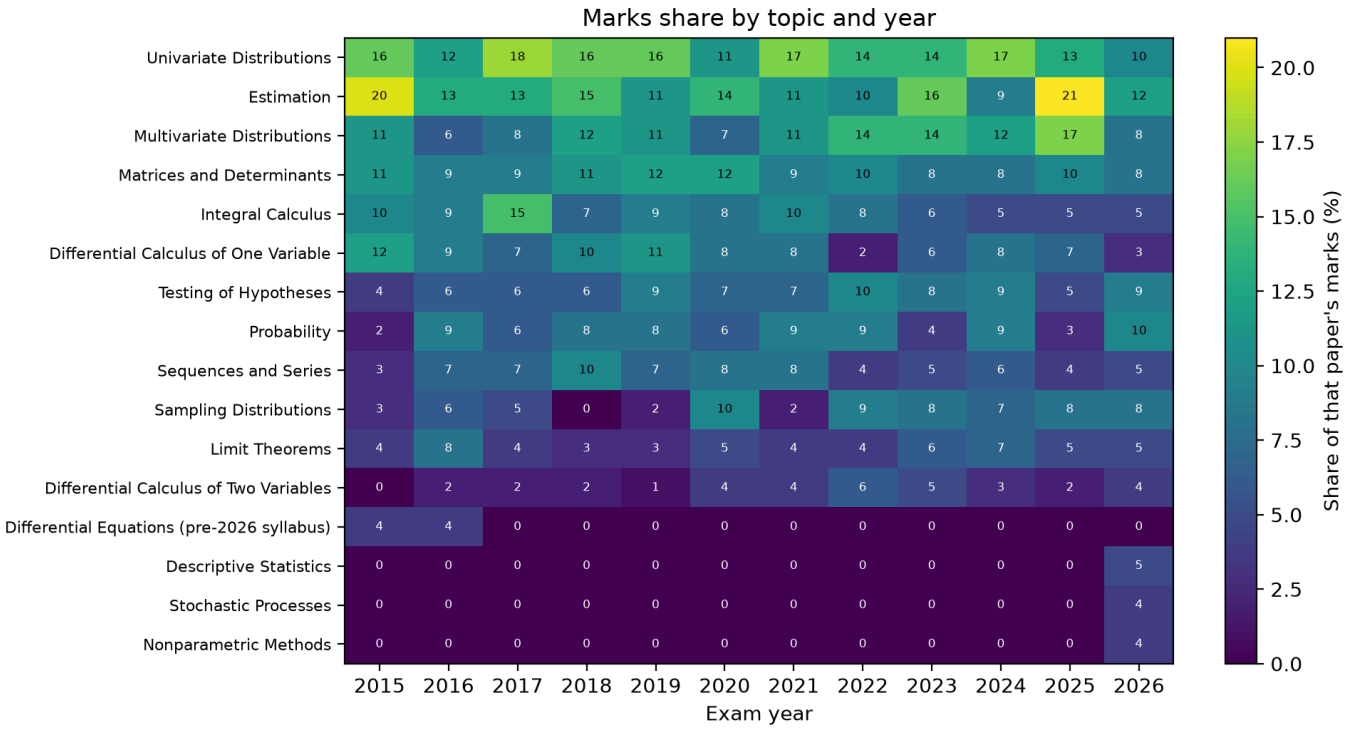

Source: JAM MS papers 2015–2026 (current format); n = 720 questions, 12 papers

4. Year-wise patterns

Average marks share, first four vs last three papers (descriptive only; with 12 papers no trend test is meaningful):

- Integral Calculus: 10.2% → 5.0%
- Differential Calculus of One Variable: 9.5% → 6.0%
- Univariate Distributions: 15.5% → 13.3%
- Testing of Hypotheses: 5.5% → 7.7%
- Multivariate Distributions: 9.2% → 12.3%
- Sampling Distributions: 3.5% → 7.7%

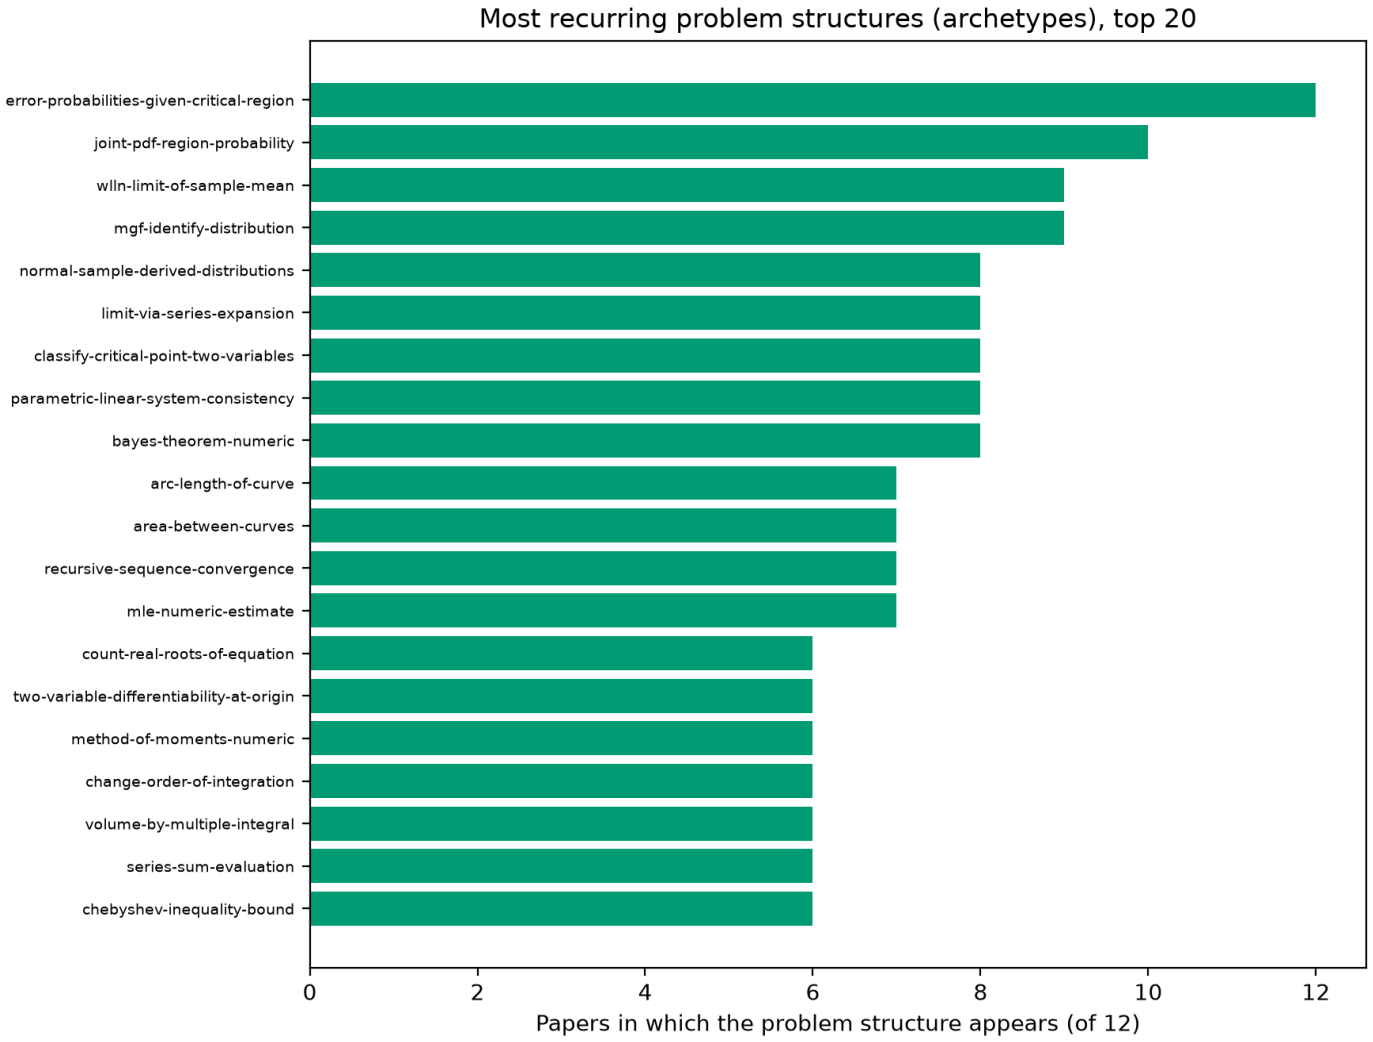

Source: JAM MS papers 2015–2026 (current format); n = 720 questions, 12 papers

5. Recurring problem structures

An archetype is a problem structure (e.g. "find error probabilities for a given critical region"). The most recurrent, by number of papers they appear in:

Topic	Archetype	Papers	Questions	Examples
Testing of Hypotheses	error-probabilities-given-critical-region	12	17	2015-MS-Q18, 2015-MS-Q3, 2016-MS-Q20, 2017-MS-Q21
Multivariate Distributions	joint-pdf-region-probability	10	11	2015-MS-Q12, 2016-MS-Q43, 2017-MS-Q15, 2019-MS-Q25
Limit Theorems	wlln-limit-of-sample-mean	9	9	2016-MS-Q9, 2017-MS-Q17, 2018-MS-Q49, 2019-MS-Q8
Univariate Distributions	mgf-identify-distribution	9	9	2016-MS-Q5, 2017-MS-Q6, 2018-MS-Q20, 2020-MS-Q55
Sampling Distributions	normal-sample-derived-distributions	8	14	2016-MS-Q18, 2016-MS-Q41, 2017-MS-Q16, 2017-MS-Q46
Differential Calculus of One Variable	limit-via-series-expansion	8	9	2016-MS-Q33, 2017-MS-Q27, 2019-MS-Q51, 2020-MS-Q13
Differential Calculus of Two Variables	classify-critical-point-two-variables	8	8	2016-MS-Q27, 2017-MS-Q25, 2019-MS-Q2, 2020-MS-Q32
Matrices and Determinants	parametric-linear-system-consistency	8	8	2015-MS-Q58, 2016-MS-Q31, 2020-MS-Q4, 2021-MS-Q28
Probability	bayes-theorem-numeric	8	8	2017-MS-Q58, 2018-MS-Q9, 2019-MS-Q55, 2021-MS-Q9

Topic	Archetype	Papers	Questions	Examples
Integral Calculus	arc-length-of-curve	7	8	2015-MS-Q57, 2016-MS-Q50, 2017-MS-Q30, 2017-MS-Q53

Source: JAM MS papers 2015–2026 (current format); n = 720 questions, 12 papers

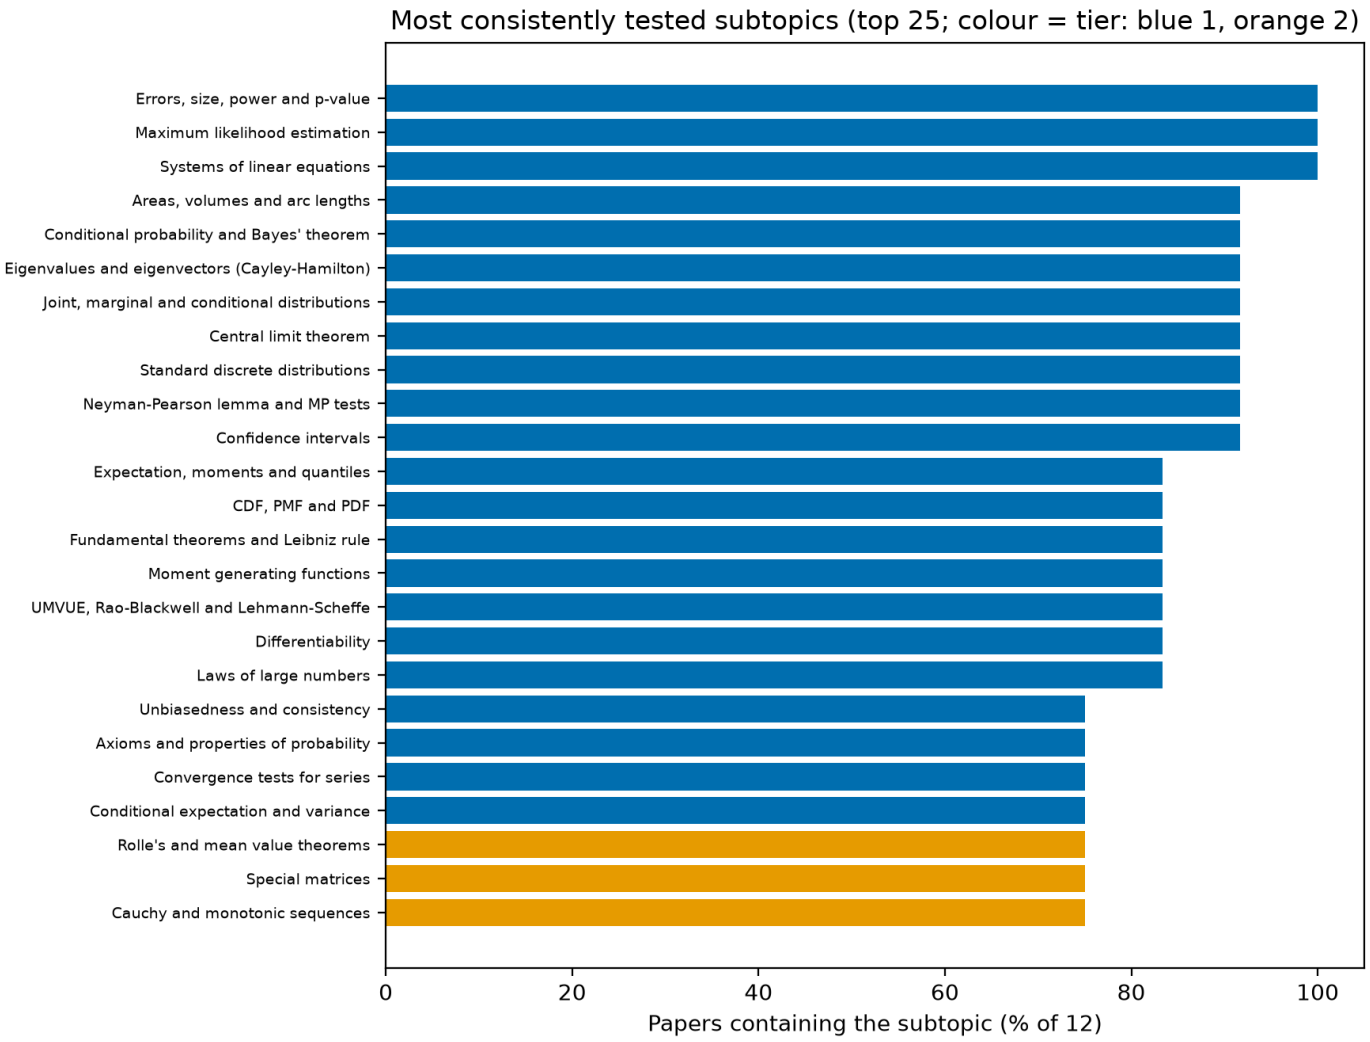

6. Priority tiers (subtopic level)

Rule, applied mechanically: **Tier 1** if the subtopic appears in ≥ 80% of papers or averages ≥ 2% of marks; **Tier 3** if it appears in < 40% of papers and averages < 1%; else Tier 2. Thresholds sit near the subtopic quartiles; they are a judgement, disclosed here. Counts: Tier 1 = 23, Tier 2 = 32, Tier 3 = 19, untested = 4. Tier 3 is "lower historical priority", never "skip".

Tier 1 subtopics

Topic	Subtopic	Questions	Papers (of 12)	Mean marks share
Integral Calculus	Areas, volumes and arc lengths	26	11	3.6%
Testing of Hypotheses	Errors, size, power and p-value	25	12	3.6%

Topic	Subtopic	Questions	Papers (of 12)	Mean marks share
Univariate Distributions	Expectation, moments and quantiles	25	10	3.4%
Probability	Conditional probability and Bayes' theorem	23	11	3.0%
Matrices and Determinants	Eigenvalues and eigenvectors (Cayley-Hamilton)	22	11	3.0%
Estimation	Maximum likelihood estimation	21	12	3.0%
Multivariate Distributions	Joint, marginal and conditional distributions	20	11	2.9%
Univariate Distributions	CDF, PMF and PDF	20	10	2.8%
Limit Theorems	Central limit theorem	18	11	2.6%
Univariate Distributions	Standard discrete distributions	18	11	2.5%
Estimation	Unbiasedness and consistency	17	9	2.4%
Integral Calculus	Fundamental theorems and Leibniz rule	17	10	2.3%
Matrices and Determinants	Systems of linear equations	15	12	2.3%
Testing of Hypotheses	Neyman-Pearson lemma and MP tests	15	11	2.2%
Sequences and Series	Convergence tests for series	14	9	2.2%
Probability	Axioms and properties of probability	15	9	2.1%
Multivariate Distributions	Covariance, correlation and joint moments	15	8	2.1%
Multivariate Distributions	Conditional expectation and variance	14	9	2.1%
Estimation	UMVUE, Rao-Blackwell and Lehmann-Scheffe	13	10	1.9%
Estimation	Confidence intervals	12	11	1.8%
Univariate Distributions	Moment generating functions	14	10	1.7%
Differential Calculus of One Variable	Differentiability	13	10	1.7%
Limit Theorems	Laws of large numbers	12	10	1.4%

Source: JAM MS papers 2015–2026 (current format); n = 720 questions, 12 papers

Full tier list for all 78 subtopics: `outputs/tables/subtopics_current.csv`.

7. Potential future areas (hypotheses, not predictions)

- **Hypothesis** strong : Univariate Distributions and Estimation will stay the heaviest topics; they were heavy in every paper.
- **Hypothesis** moderate : Sampling Distributions and Multivariate Distributions keep the larger share they have had recently, and Integral Calculus stays lighter than in 2015–2018.
- **Hypothesis** weak : the subtopics first tested in 2026 keep appearing; the only evidence is one paper (14 marks), so their likely weight is unknown.

Historical frequency is not a probability of appearance. No probabilities are given because 12 papers cannot support a defensible model.

8. Preparation recommendations

Suggested allocation (interpretation): 90% of study time in proportion to historical marks share, and a reserved 10% for the subtopics new to the syllabus (7 first tested in 2026, where they took 14% of the paper, plus 4 still untested). Historical shares dilute the new topics because they have one paper of data. Don't drop any syllabus topic for low frequency.

Topic	Suggested study time
Univariate Distributions	13.1%
Estimation	12.5%
Multivariate Distributions	9.9%
Matrices and Determinants	8.8%
Integral Calculus	7.3%
Differential Calculus of One Variable	6.9%
Testing of Hypotheses	6.5%
Probability	6.3%
Sequences and Series	5.6%
Sampling Distributions	5.1%
Limit Theorems	4.4%
Differential Calculus of Two Variables	2.6%
Descriptive Statistics	0.4%
Stochastic Processes	0.3%
Nonparametric Methods	0.3%

- Work through past papers **by problem structure** (Section 5): 44.6% of questions reuse one.
- The paper is mostly numerical/application work (70.0%): practise timed computation, not proofs (proof-type questions: 1).
- Skip ODE-only preparation: not tested since 2016 and not in the 2026 syllabus.

9. Old-format papers (2012–2014)

2012 (25 questions, 300 marks, subjective parts), 2013 (30 questions: objective, fill-in-the-blank, descriptive) and 2014 (43 questions incl. 8 descriptive) differ in structure, so they are kept out of all shares above. Heaviest topics there:

Topic	Questions	Mean marks share
Estimation	13	16.0%
Univariate Distributions	15	14.7%
Multivariate Distributions	9	10.7%
Matrices and Determinants	10	8.7%
Probability	8	7.3%

Topic	Questions	Mean marks share
Testing of Hypotheses	7	7.3%

10. Methodology and limitations

- Source: official papers from jam2026.iitb.ac.in (SHA-256 manifest). 4 papers are image scans, read with local OCR (PaddleOCR-VL); every page was audited against its image and about 70 OCR errors were fixed. Spot checks still found about 1 meaning-changing OCR slip per 4–5 unchecked pages.
- Each question is recorded as number, format, marks and pages, plus a one-line summary (no verbatim text). Counts and marks match each paper's printed instructions, section headers or printed answer key (2016, 2017 and 2022 totals are sums of printed section marks). The validator reports 0 errors on all 838 rows.
- Image verification: 2023 and 2024 in full; scans 2014, 2017 and 2025 PASS, but some of their pages were compared against the OCR text rather than the image. Text-based papers 2015–2022 were not sample-verified against images. 2026 (text PDF): every page's OCR compared with its image (5 errors fixed), format and marks match the official answer key, verifier PASS on a 5-page sample.
- Topic, archetype, cognitive type and repeat labels are model judgements (subjective). An independent reviewer agreed with 96% of uncertain topic calls (79/82). Archetypes and repeats are **moderate evidence at best**; cognitive type was not reviewed.
- The taxonomy is the 2026 syllabus, while older papers followed earlier syllabi. "Never tested" can mean "newly added".
- n = 12 papers: everything is descriptive, with no significance tests and no difficulty ratings (no score data).
- Reproducible: `python -m pyq.master && python -m pyq.report` regenerates every table, figure and this report from the frozen data. Code and data: github.com/aaditya19saini/OCR-QP-Tool.
